## What is few-shot learning

• Why is it important?

?

## **Current approaches in few-shot learning**

#### Relevant literature

- Meta-learning:
  - Optimization based.
  - Metric based.
  - Model based.
- Transfer learning.
- Feature adaptation.
- Data Augmentation.

#### Utilizing unlabeled data

- Data manifold exploitation:
  - Label propagation.
  - Embedding propagation.
- Iterative pseudo-label selection.
- Class centroid refinement:
  - Soft k-means.
  - Minimizing loss functions.

#### **Motivation**

#### **Traditional Label Propagation algorithm**

- We investigate the widely popular label propagation algorithm.
- We identify a limitation of label propagation, that the labeled data are fixed and may be in sub optimal positions.

#### Contributions

- We propose a novel variant of label propagation algorithm named Adaptive Anchor Label Propagation ( ${f A^2LP}$ ).
- A<sup>2</sup>LP optimizes the positions of the labeled data also referred to as labeled anchors.
- A<sup>2</sup>LP outperforms significantly the traditional label propagation in transductive few-shot learning.

#### **Motivation**

#### **Traditional Label Propagation algorithm**

- We investigate the widely popular label propagation algorithm.
- We identify a limitation of label propagation, that the labeled data are fixed and may be in sub optimal positions.

#### **Contributions**

- We propose a novel variant of label propagation algorithm named Adaptive Anchor Label Propagation (A<sup>2</sup>LP).
- $A^2LP$  optimizes the positions of the labeled data also referred to as labeled anchors.
- A<sup>2</sup>LP outperforms significantly the traditional label propagation in transductive few-shot learning.

#### **Problem formulation and definitions**

#### Pre-training stage

- We use publicly available pre-trained networks from published works.
- Base class dataset:  $D_{\text{base}} := \{(x_i, y_i)\}_{i=1}^I$  where  $y_i \in C_{\text{base}}$ .
- Network  $f_{\theta}: \mathcal{X} \to \mathbb{R}^d$  is trained on  $D_{\text{base}}$ .

#### Inference stage

- Novel class dataset  $D_{\text{novel}}$  with  $C_{\text{novel}}$  disjoint from  $C_{\text{base}}$ .
- Assume access to  $f_{\theta}$ , a support set, S, a query set, Q.
- We focus on transductive few-shot learning, where all S and Q are available at inference at the same time.

#### **Problem formulation and definitions**

A <sup>2</sup> LP+PLC	$75.94{\scriptstyle\pm0.72}$	<b>85.67</b> ±0.42	<b>83.68</b> ±0.72	<b>90.53</b> ±0.43			

• Outperforming several state of the art methods.

#### **Conclusion**

- We propose a novel variant of label propagation.
- Our algorithm iteratively adapts the labeled anchors.
- Significantly outperforms the traditional algorithm.
- Outperforms several state of the art methods.
- Future directions:
  - Different loss functions.
  - Beyond few-shot learning.
